(54) Title: LIGHT-EMITTING DEVICES HAVING MULTIPLE ENCAPSULATION LAYERS WITH AT LEAST ONE OF THE ENCAPSULATION LAYERS INCLUDING NANOPARTICLES AND METHODS OF FORMING THE SAME

(57) Abstract: A light-emitting device includes an active region that is configured to emit light responsive to a voltage applied thereto. A first encapsulation layer at least partially encapsulates the active region and includes a matrix material and nanoparticles, which modify at least one physical property of the first encapsulation layer. A second encapsulation layer at least partially encapsulates the first encapsulation layer.

LIGHT-EMITTING DEVICES HAVING MULTIPLE ENCAPSULATION LAYERS
WITH AT LEAST ONE OF THE ENCAPSULATION LAYERS INCLUDING
NANOPARTICLES AND METHODS OF FORMING THE SAME

Field of the Invention

The present invention relates generally to microelectronic devices and fabrication methods therefor, and, more particularly, to light-emitting devices and fabrication methods therefor.

Background of the Invention

5

Light-emitting diodes (LEDs) are widely used in consumer and commercial applications. As is well known to those skilled in the art, a light-emitting diode generally includes an active region on a microelectronic substrate. The microelectronic substrate may comprise, for example, gallium arsenide, gallium phosphide, alloys thereof, silicon carbide, and/or sapphire. Continued developments in LEDs have resulted in highly efficient and mechanically robust light sources that can cover the visible spectrum and beyond. These attributes, coupled with the potentially long service life of solid state devices, may enable a variety of new display applications, and may place LEDs in a position to compete with well entrenched incandescent and/or fluorescent lamps.

10

15

Standard LED packaging typically comprises an epoxy-based encapsulation layer to both protect the active device from the elements and to enhance the optical output of the LED dice. Unfortunately, an epoxy-based encapsulation layer may optically degrade when used with relatively short wavelength (*e.g.*, 525 nm), high flux LEDs.

20

Summary of the Invention

According to some embodiments of the present invention, a light-emitting device includes an active region that is configured to emit light responsive to a voltage applied thereto. A first encapsulation layer at least partially encapsulates the active region and includes a matrix material and nanoparticles, which modify at least one physical property of the first encapsulation layer. A second encapsulation layer at least partially encapsulates the first encapsulation layer.

In other embodiments of the present invention, the matrix material comprises silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer.

In still other embodiments of the present invention, the first encapsulation layer is substantially transparent.

In still other embodiments of the present invention, the nanoparticles comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials.

In still other embodiments of the present invention, the at least one physical property comprises index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability.

In further embodiments of the present invention, the matrix material is a first matrix material, and the nanoparticles are first nanoparticles. The second encapsulation layer comprises a second matrix material and second nanoparticles that modify at least one physical property of the second encapsulation layer.

In still further embodiments of the present invention, the second matrix material comprises silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer.

In still further embodiments of the present invention, the second encapsulation layer is substantially transparent.

In still further embodiments of the present invention, the second nanoparticles comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials.

In still further embodiments of the present invention, the at least one physical property of the second encapsulation layer comprises index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability.

5 In still further embodiments of the present invention, an outer surface of the first encapsulation layer, opposite the active region, may be shaped so that light rays from the active region are not incident on the first encapsulation layer at an angle that is greater than a critical angle.

Although described primarily above with respect to device embodiments of the present invention, it will be understood that the present invention may also be embodied as fabrication methods of forming light-emitting devices.

Brief Description of the Drawings

Other features of the present invention will be more readily understood from the following detailed description of specific embodiments thereof when read in conjunction with the accompanying drawings, in which:

15 **FIGS. 1A - 1B** are cross-sectional diagrams that illustrate light-emitting devices and fabrication methods therefor, in accordance with some embodiments of the present invention;

FIGS. 2A - 2C are cross-sectional diagrams that illustrate light-emitting devices and fabrication methods therefor, in accordance with additional embodiments of the present invention; and

FIGS. 3A - 3D are cross-sectional diagrams that illustrate light-emitting devices and fabrication methods therefor, in accordance with additional embodiments of the present invention.

Detailed Description of Preferred Embodiments

25 While the invention is susceptible to various modifications and alternative forms, specific embodiments thereof are shown by way of example in the drawings and will herein be described in detail. It should be understood, however, that there is no intent to limit the invention to the particular forms disclosed, but on the contrary, the invention is to cover all modifications, equivalents, and alternatives falling within the spirit and scope of the invention as defined by the claims. Like numbers refer to like elements throughout the description of the figures. In the figures, the dimensions

of layers and regions are exaggerated for clarity. Each embodiment described herein also includes its complementary conductivity type embodiment.

It will be understood that when an element such as a layer, region or substrate is referred to as being "on" another element, it can be directly on the other element or
5 intervening elements may also be present. It will be understood that if part of an element, such as a surface, is referred to as "inner," it is farther from the outside of the device than other parts of the element. Furthermore, relative terms such as "beneath" or "overlies" may be used herein to describe a relationship of one layer or region to another layer or region relative to a substrate or base layer as illustrated in the figures.
10 It will be understood that these terms are intended to encompass different orientations of the device in addition to the orientation depicted in the figures. Finally, the term "directly" means that there are no intervening elements. As used herein, the term "and/or" includes any and all combinations of one or more of the associated listed items.

15 It will be understood that, although the terms first, second, etc. may be used herein to describe various elements, components, regions, layers and/or sections, these elements, components, regions, layers and/or sections should not be limited by these terms. These terms are only used to distinguish one element, component, region, layer or section from another region, layer or section. Thus, a first region, layer or section
20 discussed below could be termed a second region, layer or section, and, similarly, a second without departing from the teachings of the present invention.

Embodiments of the present invention will now be described, generally, with reference to GaN-based light-emitting diodes (LEDs) on SiC-based or sapphire (Al₂O₃)-based substrates. The present invention, however, is not limited to such
25 structures. Examples of light-emitting devices that may be used in embodiments of the present invention include, but are not limited to, LEDs and/or laser diodes, such as devices manufactured and sold by Cree, Inc. of Durham, North Carolina. For example, the present invention may be suitable for use with LEDs and/or lasers as described in United States Patent Nos. 6,201,262, 6,187,606, 6,120,600, 5,912,477,
30 5,739,554, 5,631,190, 5,604,135, 5,523,589, 5,416,342, 5,393,993, 5,338,944, 5,210,051, 5,027,168, 5,027,168, 4,966,862 and/or 4,918,497, the disclosures of which are incorporated herein by reference as if set forth fully herein. Other suitable LEDs and/or lasers are described in United States Patent Application Serial No.

10/140,796, entitled "GROUP III NITRIDE BASED LIGHT EMITTING DIODE STRUCTURES WITH A QUANTUM WELL AND SUPERLATTICE, GROUP III NITRIDE BASED QUANTUM WELL STRUCTURES AND GROUP III NITRIDE BASED SUPERLATTICE STRUCTURES", filed May 7, 2002, as well as United States Patent Application Serial No. 10/057,821, filed January 25, 2002 entitled "LIGHT EMITTING DIODES INCLUDING SUBSTRATE MODIFICATIONS FOR LIGHT EXTRACTION AND MANUFACTURING METHODS THEREFOR" the disclosures of which are incorporated herein as if set forth fully. Furthermore, phosphor coated LEDs, such as those described in United States Patent Application Serial No. 10/659,241 entitled "PHOSPHOR-COATED LIGHT EMITTING DIODES INCLUDING TAPERED SIDEWALLS, AND FABRICATION METHODS THEREFOR," filed September 9, 2003, the disclosure of which is incorporated by reference herein as if set forth full, may also be suitable for use in embodiments of the present invention.

15 The LEDs and/or lasers may be configured to operate in a "flip-chip" configuration such that light emission occurs through the substrate. In such embodiments, the substrate may be patterned so as to enhance light output of the devices as is described, for example, in United States Patent Application Serial No. 10/057,821, filed January 25, 2002 entitled "LIGHT EMITTING DIODES INCLUDING SUBSTRATE MODIFICATIONS FOR LIGHT EXTRACTION AND MANUFACTURING METHODS THEREFOR" the disclosure of which is incorporated herein by reference as if set forth fully herein.

FIGS. 1A - 1B are cross-sectional diagrams that illustrate light-emitting devices and fabrication methods therefor, in accordance with some embodiments of the present invention. Referring now to **FIG. 1A**, a light-emitting device 10, in accordance with some embodiments of the present invention, includes an LED, which includes an anode terminal 12, an active region 13, such as a diode region, and a cathode terminal 14, which are electrically coupled to one another. The active region 13 is configured to emit light responsive to a voltage applied thereto via, for example, the anode and cathode terminals 12 and 14. The light-emitting device 10 further includes a first encapsulation layer 16, which includes, for example, a matrix material and nanoparticles that modify at least one physical property, such as, for example, index of refraction, thermal conductivity, mechanical strength, abrasion resistance,

and/or optical stability of the first encapsulation layer 16. The first encapsulation layer 16 at least partially encapsulates the active region in accordance with some embodiments of the present invention and may be substantially transparent. In accordance with various embodiments of the present invention, the matrix material
5 may comprise silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer. Advantageously, the silicone gel is generally optically stable when exposed to relatively high flux, short wavelength light (e.g., on the order of 525 nm). The nanoparticles in the first encapsulation layer 16 may comprise TiO₂, diamond, silicon carbide, scattering particles, fillers, phosphors,
10 and/or light conversion materials. Thus, for example, the first encapsulation layer 16 may comprise a silicone gel having TiO₂ nanoparticles contained therein. The TiO₂ nanoparticles contained in the silicone gel may increase the index of refraction of the first encapsulation layer 16 to allow the index of refraction of the first encapsulation layer 16 to more closely match the index of refraction of the active region 13 thereby
15 improving light extraction from the active region 13.

When light travels from one medium to another, it may be refracted such that the angle of refraction is governed by Snell's law as follows: $n_1 \sin \theta_1 = n_2 \sin \theta_2$, where n_1 is the index of refraction for medium 1 and n_2 is the index of refraction for medium 2. The light that escapes, however, has an angular dependence that is less than the
20 "critical angle," which is defined as follows $\theta_{\text{critical}} = \sin^{-1}(n_2/n_1)$. Light that is incident at an angle greater than the critical angle does not pass through to medium 2, but is instead reflected back into medium 1. This reflection is commonly called total internal reflection. To further improve light extraction from the first encapsulation layer 16, an outer surface of the first encapsulation layer 16, opposite the active region
25 13, may be shaped so that light rays from the active region 13 are not incident on the first encapsulation layer 16 at an angle that is greater than the critical angle, in accordance with some embodiments of the present invention.

Referring now to FIG. 1B, the first encapsulation layer 16 is at least partially encapsulated with a second encapsulation layer 18, which may comprise a second
30 matrix material and second nanoparticles that modify at least one physical property, such as, for example, index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability of the second encapsulation layer 18. The

second encapsulation layer 18 and may be substantially transparent. In accordance with various embodiments of the present invention, the second matrix material may comprise silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer. The second nanoparticles may comprise
5 TiO₂, diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials.

In particular embodiments of the present invention, the second encapsulation layer 18 may include epoxy, plastic, and/or glass to add rigidity to the packaging of the light-emitting device 10. To improve the thermal characteristics of the packaging,
10 a third encapsulation layer 19, which may be substantially transparent, may be used to at least partially encapsulate the second encapsulation layer 18 in accordance with some embodiments of the present invention. The third encapsulation layer 19 may include a thermally conductive material. In accordance with particular embodiments of the present invention, the first, second, and third encapsulation layers 16, 18, and
15 19 may be formed using a casting process.

FIGS. 2A - 2C are cross-sectional diagrams that illustrate light-emitting devices and fabrication methods therefor, in accordance with further embodiments of the present invention. Referring now to **FIG. 2A**, a light-emitting device 20, in accordance with some embodiments of the present invention, includes an LED, which
20 includes an anode terminal 22, an active region 23, such as a diode region, and a cathode terminal 24, which are electrically coupled to one another. The active region 23 is configured to emit light responsive to a voltage applied thereto via, for example, the anode and cathode terminals 22 and 24. The light-emitting device 20 further includes a first encapsulation layer 26, which includes, for example, a matrix material
25 and nanoparticles that modify at least one physical property, such as, for example, index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability of the first encapsulation layer 26. The first encapsulation layer 26 at least partially encapsulates the active region in accordance with some embodiments of the present invention and may be substantially transparent. In
30 accordance with various embodiments of the present invention, the matrix material may comprise silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer. The nanoparticles in the first

encapsulation layer 26 may comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials. Thus, for example, the first encapsulation layer 26 may comprise silicone gel, epoxy, and/or a polymer having TiO_2 nanoparticles contained therein. The TiO_2 nanoparticles contained in the matrix material may increase the index of refraction of the first encapsulation layer 26 to allow the index of refraction of the first encapsulation layer 26 to more closely match the index of refraction of the active region 23 thereby improving light extraction from the active region 23.

To further improve light extraction from the first encapsulation layer 26, an outer surface of the first encapsulation layer 26, opposite the active region 23, may be shaped so that light rays from the active region 23 are not incident on the first encapsulation layer 26 at an angle that is greater than the critical angle, in accordance with some embodiments of the present invention. In addition, the first encapsulation layer 26 may further include phosphor particles, to fabricate, for example, a white LED lamp, in accordance with some embodiments of the present invention. In accordance with particular embodiments of the present invention, the first encapsulation layer 26 may be formed using a casting or dispensing process.

Referring now to FIG. 2B, the light-emitting device 20 further comprises a second encapsulation layer 27 that at least partially encapsulates the first encapsulation layer 26 and may be substantially transparent. The second encapsulation layer 27 may comprise a second matrix material and second nanoparticles that modify at least one physical property, such as, for example, index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability of the second encapsulation layer 27. In accordance with various embodiments of the present invention, the second matrix material may comprise silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer. The second nanoparticles may comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials. Thus, in particular embodiments of the present invention, the second encapsulation layer 27 may comprise silicone gel.

Referring now to FIG. 2C, the second encapsulation layer 27 is at least partially encapsulated with a third encapsulation layer 28, which may be substantially

transparent and may comprise a third matrix material and third nanoparticles that modify at least one physical property, such as, for example, index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability of the third encapsulation layer 28. In accordance with various embodiments of the present invention, the third matrix material may comprise silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer. The third nanoparticles may comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials.

In particular embodiments of the present invention, the third encapsulation layer 28 may include epoxy, plastic, and/or glass to add rigidity to the packaging of the light-emitting device 20. To improve the thermal characteristics of the packaging, a fourth encapsulation layer 29 may be used to at least partially encapsulate the third encapsulation layer 28 in accordance with some embodiments of the present invention. The fourth encapsulation layer 29 may include a thermally conductive material and may be substantially transparent. In accordance with particular embodiments of the present invention, the second, third, and fourth encapsulation layers 27, 28, and 29 may be formed using a casting process.

FIGS. 3A - 3D are cross-sectional diagrams that illustrate light-emitting devices and fabrication methods therefor, in accordance with some other embodiments of the present invention. Referring now to FIG. 3A, a light-emitting device 30, in accordance with some embodiments of the present invention, includes an LED, which includes an anode terminal 32, an active region 33, such as a diode region, and a cathode terminal 34, which are electrically coupled to one another. The active region 33 is configured to emit light responsive to a voltage applied thereto via, for example, the anode and cathode terminals 32 and 34. The light-emitting device 30 further includes a first encapsulation layer 35, which includes, for example, a matrix material and nanoparticles that modify at least one physical property, such as, for example, index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability of the first encapsulation layer 35. The first encapsulation layer 35 at least partially encapsulates the active region and may be substantially transparent in accordance with some embodiments of the present invention. In accordance with various embodiments of the present invention, the matrix material may comprise silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-

gel, aerogel, and/or an optically stable polymer. The nanoparticles in the first encapsulation layer 35 may comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials. Thus, for example, the first encapsulation layer 35 may comprise silicone gel, epoxy, and/or a polymer having TiO_2 nanoparticles contained therein. The TiO_2 nanoparticles contained in the matrix material may increase the index of refraction of the first encapsulation layer 36 to allow the index of refraction of the first encapsulation layer 35 to more closely match the index of refraction of the active region 35 thereby improving light extraction from the active region 33.

To further improve light extraction from the first encapsulation layer 35, an outer surface of the first encapsulation layer 35, opposite the active region 33, may be shaped so that light rays from the active region 33 are not incident on the first encapsulation layer 35 at an angle that is greater than the critical angle, in accordance with some embodiments of the present invention.

Referring now to FIG. 3B, the light-emitting device 30 further comprises a second encapsulation layer 36 that at least partially encapsulates the first encapsulation layer 35 and may be substantially transparent. The second encapsulation layer 36 may comprise a second matrix material and second nanoparticles that modify at least one physical property, such as, for example, index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability of the second encapsulation layer 36. In accordance with various embodiments of the present invention, the second matrix material may comprise silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer. The second nanoparticles may comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials. Thus, in particular embodiments of the present invention, the second encapsulation layer 36 may comprise silicone gel, epoxy, and/or a polymer having phosphor particles contained therein to fabricate, for example, a white LED lamp, in accordance with some embodiments of the present invention. In addition, the second encapsulation layer 36 may further include TiO_2 nanoparticles in accordance with some embodiments of the present invention. Advantageously, by separating the second encapsulation layer 36 from the active region 33, increased light output may be

obtained from the light-emitting device. In accordance with particular embodiments of the present invention, the first and second encapsulation layers 35 and 36 may be formed using a casting or dispensing process.

Referring now to **FIG. 3C**, the light-emitting device 30 further comprises a
5 third encapsulation layer 37, that at least partially encapsulates the second encapsulation layer 36 and may be substantially transparent. The third encapsulation layer 37 may comprise a third matrix material and third nanoparticles that modify at least one physical property, such as, for example, index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability of the
10 third encapsulation layer 37. In accordance with various embodiments of the present invention, the third matrix material may comprise silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer. The third nanoparticles may comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials. Thus, in particular
15 embodiments of the present invention, the third encapsulation layer 37 may comprise silicone gel.

Referring now to **FIG. 3D**, the third encapsulation layer 37 is at least partially encapsulated with a fourth encapsulation layer 38, which may be substantially transparent and may comprise a fourth matrix material and fourth nanoparticles that
20 modify at least one physical property, such as, for example, index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability of the fourth encapsulation layer 38. In accordance with various embodiments of the present invention, the fourth matrix material may comprise silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically
25 stable polymer. The fourth nanoparticles may comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials.

In particular embodiments of the present invention, the fourth encapsulation layer 38 may include epoxy, plastic, and/or glass to add rigidity to the packaging of the light-emitting device 30. To improve the thermal characteristics of the packaging,
30 a fifth encapsulation layer 39 may be used to at least partially encapsulate the fourth encapsulation layer 38 in accordance with some embodiments of the present invention. The fifth encapsulation layer 39 may include a thermally conductive material and may be substantially transparent. In accordance with particular

embodiments of the present invention, the third, fourth, and fifth encapsulation layers 37, 38, and 39 may be formed using a casting process.

5 In general, embodiments of the invention may comprise a sequence of multiple (two or more) encapsulation layers, each either fully or partially encapsulating the previous layers or light-emitting device. Each encapsulation layer may comprise one of a variety of matrix, nanoparticle, additive/filler materials as described above, and each layer may serve a specific complimentary function to improve the performance of the resulting package. It is generally desirable that the encapsulation layers do not substantially absorb light from the light-emitting device. Moreover, the interface
10 between the encapsulation layers may be designed to enhance the optical and/or chemical properties. Compatibility of chemical and other physical properties, such as chemical reactions, adhesion, thermal expansion, etc. may place constraints upon the geometry and/or the configuration of the interface between various encapsulation layers.

15 In concluding the detailed description, it should be noted that many variations and modifications can be made to the preferred embodiments without substantially departing from the principles of the present invention. All such variations and modifications are intended to be included herein within the scope of the present invention, as set forth in the following claims.

Claims

That which is claimed:

1. A light-emitting device, comprising:
5 an active region that is configured to emit light responsive to a voltage applied thereto;
a first encapsulation layer that at least partially encapsulates the active region, the first encapsulation layer comprising a matrix material and nanoparticles that modify at least one physical property of the first encapsulation layer; and
10 a second encapsulation layer that at least partially encapsulates the first encapsulation layer.
2. The light-emitting device of Claim 1, wherein the matrix material comprises silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel,
15 aerogel, and/or an optically stable polymer.
3. The light-emitting device of Claim 1, wherein the first encapsulation layer is substantially transparent.
- 20 4. The light-emitting device of Claim 1, wherein the nanoparticles comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials.
5. The light-emitting device of Claim 1, wherein the at least one physical
25 property comprises index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability.
6. The light-emitting device of Claim 1, wherein the matrix material is a first matrix material, and the nanoparticles are first nanoparticles and wherein the
30 second encapsulation layer comprises a second matrix material and second nanoparticles that modify at least one physical property of the second encapsulation layer.

7. The light-emitting device of Claim 6, wherein the second matrix material comprises silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer.

5 8. The light-emitting device of Claim 6, wherein the second encapsulation layer is substantially transparent.

9. The light-emitting device of Claim 6, wherein the second nanoparticles comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors,
10 and/or light conversion materials.

10. The light-emitting device of Claim 6, wherein the at least one physical property of the second encapsulation layer comprises index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability.

15

11. The light-emitting device of Claim 1, wherein an outer surface of the first encapsulation layer, opposite the active region, is shaped so that light rays from the active region are not incident on the first encapsulation layer at an angle that is greater than a critical angle.

20

12. A method of forming a light-emitting device, comprising:

forming an active region that is configured to emit light responsive to a voltage applied thereto;

forming a first encapsulation layer that at least partially encapsulates the active
25 region, the first encapsulation layer comprising a matrix material and nanoparticles that modify at least one physical property of the first encapsulation layer; and

forming a second encapsulation layer that at least partially encapsulates the first encapsulation layer.

30 13. The method of Claim 12, wherein the matrix material comprises silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer.

14. The method of Claim 12, wherein the first encapsulation layer is substantially transparent.

15. The method of Claim 12, wherein the nanoparticles comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials.

16. The method of Claim 12, wherein the at least one physical property comprises index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability.

17. The method of Claim 12, wherein the matrix material is a first matrix material, and the nanoparticles are first nanoparticles and wherein the second encapsulation layer comprises a second matrix material and second nanoparticles that modify at least one physical property of the second encapsulation layer.

18. The method of Claim 17, wherein the second matrix material comprises silicone, a silicone compound, an optical gel, epoxy resin, glass, sol-gel, aerogel, and/or an optically stable polymer.

19. The method of Claim 17, wherein the second encapsulation layer is substantially transparent.

20. The method of Claim 17, wherein the second nanoparticles comprise TiO_2 , diamond, silicon carbide, scattering particles, fillers, phosphors, and/or light conversion materials.

21. The method of Claim 17, wherein the at least one physical property of the second encapsulation layer comprises index of refraction, thermal conductivity, mechanical strength, abrasion resistance, and/or optical stability.

22. The method of Claim 12, wherein an outer surface of the first encapsulation layer, opposite the active region, is shaped so that light rays from the

active region are not incident on the first encapsulation layer at an angle that is greater than a critical angle.

INTERNATIONAL SEARCH REPORT

International Application No

PCT/US2005/011592

A. CLASSIFICATION OF SUBJECT MATTER

IPC 7 H05B33/04

According to International Patent Classification (IPC) or to both national classification and IPC

B. FIELDS SEARCHED

Minimum documentation searched (classification system followed by classification symbols)

IPC 7 H05B

Documentation searched other than minimum documentation to the extent that such documents are included in the fields searched

Electronic data base consulted during the international search (name of data base and, where practical, search terms used)

EPO-Internal, WPI Data, PAJ, COMPENDEX, INSPEC

C. DOCUMENTS CONSIDERED TO BE RELEVANT

Category *	Citation of document, with indication, where appropriate, of the relevant passages	Relevant to claim No.
X	US 2003/122482 A1 (YAMANAKA OSAMU ET AL) 3 July 2003 (2003-07-03) pages 1-4,6-7; claims -----	1-22
X	US 2004/004434 A1 (NISHI TAKESHI ET AL) 8 January 2004 (2004-01-08) pages 1-6,8 -----	1-22
X	US 2003/117068 A1 (FORREST STEPHEN ET AL) 26 June 2003 (2003-06-26) the whole document -----	1-22
A	EP 0 961 525 A (SEIKO EPSON CORPORATION) 1 December 1999 (1999-12-01) columns 4,8; claims -----	1-22
	-/--	

Further documents are listed in the continuation of box C.

Patent family members are listed in annex.

* Special categories of cited documents:

- *A* document defining the general state of the art which is not considered to be of particular relevance
- *E* earlier document but published on or after the international filing date
- *L* document which may throw doubts on priority claim(s) or which is cited to establish the publication date of another citation or other special reason (as specified)
- *O* document referring to an oral disclosure, use, exhibition or other means
- *P* document published prior to the international filing date but later than the priority date claimed

- *T* later document published after the international filing date or priority date and not in conflict with the application but cited to understand the principle or theory underlying the invention
- *X* document of particular relevance; the claimed invention cannot be considered novel or cannot be considered to involve an inventive step when the document is taken alone
- *Y* document of particular relevance; the claimed invention cannot be considered to involve an inventive step when the document is combined with one or more other such documents, such combination being obvious to a person skilled in the art.
- *&* document member of the same patent family

Date of the actual completion of the international search

12 August 2005

Date of mailing of the international search report

23/08/2005

Name and mailing address of the ISA

European Patent Office, P.B. 5618 Patentlaan 2
